

THE GLOBAL GOALS
For Sustainable Development

SoftControl

Follow us

Softcontrol A/S has been a manufacturer of Energy Management Systems (EMS) since 1997 and in recent years has developed the intelligent home - "CleverHouse". The system is a complete intelligent energy management package for smaller homes, where everything is controlled via an app. For larger installations, the company has developed the "EnergySystem" solution, which is used in businesses, schools, hotels, churches, holiday centers and housing associations.

As a second leg, called "SunSystem", SoftControl A/S has been working with solar cells since 2007 and thus one of the pioneers in Denmark. SoftControl supplies complete solar systems from kW to MW.

The 3rd leg in SoftControl's product portfolio is Battery Energy Storage Systems (BESS), which is expected to play a decisive role in the green transition. With BESS, it is possible to optimize your electricity bill, based on optimal charging, based on electricity prices and/or solar cell production. In addition, BESS can also be used to stabilize the electricity grid, which is becoming more and more challenged with the greater amount of energy from wind and sun.

The entire EMS platform will have an important role in the green transition. The system is ideal for the future electrification that we are looking at. It is expected that EMS will be the major growth engine in the coming years.

The solutions are primarily sold through resellers who are typically electrical or plumbing installers and via other major players.
